Portrush revenues increase

Vancouver, B.C. - Portrush Petroleum Corporation has been advised by the operator of its Lenox property that production has increased significantly with the addition of a pump on the Martin well. The Martin and Richards wells produce light crude from the Niagaran reef reservoir.

Portrush has a 22.5% working interest in the Lenox property located in Macomb County, Michigan. Additional seismic work continues on the property in an effort to delineate the true size of the reef and additional wells will be drilled to evaluate the up-hole gas already encountered in the producing wells. Typical reefs in the area can vary in size from approximately 300,000 barrels and 2 BCF to over 1,000,000 barrels and 10 BCF of recoverable reserves.

“With pumps on both the Martin and Richard wells, daily production is approximately 120 barrels a day and, with the significant increase in the price of oil, gross daily revenues are now between six and seven thousand dollars. In addition, we are now receiving our first production revenue from the Mission River project”, said Mr. Martin Cotter, President of the Company.
